Asset risk management like you've never seen it before
Unparalleled asset visibility based on device existence, not behavior

Asset risk management can be tricky when you have blind spots. Gaps in hardware visibility make managing asset risks a challenge for security teams, leaving the enterprise vulnerable. Security by design is the foundation with which Lenovo builds its ThinkShield portfolio, offering customers the most secure endpoint protection. That means delivering solutions that provide the necessary visibility to take care of blind spots and make risk management a more manageable process.

Lenovo customers now have the opportunity to purchase devices with Sepio, benefitting from ultimate hardware visibility, real-time policy enforcement, enhanced IoT security, and risk mitigation. By combining industry-leading Lenovo devices with the gold standard of hardware security, customers benefit from autonomous hardware risk management in a single solution.

COMPLETE ASSET VISIBILITY

- Agnostic device visibility - Sepio detects and identifies all hardware assets whether they are IT, OT, or IoT

- Component level visibility - Sepio's patented technology, augmented by a unique machine learning algorithm, generates an objective DNA profile for every known and shadow asset on USB interfaces to reveal their true identity

RISK SCORING

- Multiple risk indicators determine each device's risk score

- Continuous monitoring for real-time risk scoring

- Proactive detection of vulnerabilities

POLICY ENFORCEMENT

- Enforce granular hardware access control rules based on device characteristics and risk scores

- A centralized Zero Trust Hardware Access approach

SEAMLESS INTEGRATION

- Fully integrated as a critical part of ThinkShield, licenses can be purchased along with Lenovo hardware

- Enhance current security efforts and maximize investments
